~~This optimization technique builds towards a solution by first solving a smallpart of the whole problem, and then gradually incrementing the size in a seriesof stages until the whole problem is solved. Efficiency results fromcombining the local solution for a stage with the optimum found for a previousstage.~~

A Gentle, Geometric Introduction to Copositive Optimization. Samuel Burer September 25, 2014 Revised: January 17, 2015.

Abstract This paper illustrates the fundamental connection between nonconvex quadratic optimization and copositive optimization | a connection that allows the reformulation of nonconvex quadratic problems as convex ones in a unified way.

Gentle Introduction to the Adam Optimization Algorithm for Deep Learning. By Jason Brownlee on July 3, 2017 in Deep Learning Performance. Last Updated on August 20, 2020. The choice of optimization algorithm for your deep learning model can mean the difference between good results in minutes, hours, and days. The Adam optimization algorithm is an extension to stochastic gradient descent that has recently seen broader adoption for deep learning applications in computer vision and natural ...

Density estimation is the problem of estimating the probability distribution for a sample of observations from a problem domain. There are many techniques for solving density estimation, although a common framework used throughout the field of machine learning is maximum likelihood estimation. Maximum likelihood estimation involves defining a likelihood function for calculating the conditional ...

Cross-entropy is commonly used in machine learning as a loss function. Cross-entropy is a measure from the field of information theory, building upon entropy and generally calculating the difference between two probability distributions. It is closely related to but is different from KL divergence that calculates the relative entropy between two probability distributions, whereas cross-entropy ...
