Blindsight A Case Study And  
Abstract. Damage to a particular area of the brain — the neocortex — is generally understood to result in blindness. Studies of some patients who have suffered from this form of blindness have nevertheless revealed that they can, in fact, discriminate certain types of visual events within their 'blind' fields without being aware that they can do so: they think they are only 'guessing'.

This phenomenon has been termed "blindsight" by Professor Weiskrantz and his collaborators, who were among the first to describe it. This now classic study, first published ingives other cases reported and other investigators, in which there into a particular case blindsight, together with a discussion unexpected findings of residual function.

Weiskrantz blindsight a case study and implications: Review  
Blindsight is the ability of people who are cortically blind due to lesions in their striate cortex, also known as the primary visual cortex or V1, to respond to visual stimuli that they do not consciously see. The majority of studies on blindsight are conducted on patients who have the conscious blindness on only one side of their visual field. Following the destruction of the striate cortex, patients are asked to detect, localize, and discriminate amongst visual stimuli that are presented to t
