IPsec DVTI's allow you to create highly secure connectivity for remote access VPNs and can be combined with Cisco Architecture for Voice, Video, and Integrated Data (AVVID) to deliver converged voice, video, and data over IP networks. The DVTI simplifies Virtual Private Network (VRF) routing and forwarding- (VRF-) aware IPsec deployment.

IPsec Virtual Tunnel Interface - Cisco Systems

VTI over IPSec allows for a simplified implementation of site-to-site VPN on Cisco routers. The solution allows network engineers to leverage on internet connectivity to establish a secure communication path between two locations that can be continents apart.

VTI over ipsec configuration on cisco router for Site-to ...

VPN traffic is forwarded to the IPsec VTI for encryption and then sent out the physical interface. The tunnel on subnet 10 checks packets for the IPsec policy and passes them to the Crypto Engine (CE) for IPsec encapsulation. The figure below illustrates the IPsec VTI configuration.

IPsec Virtual Tunnel Interface [Support] - Cisco Systems

Static VTI (VTI) With DVTI, we use a single virtual template on our hub router. Whenever a new IPsec session is needed, the router automatically creates a virtual access interface that is cloned from the virtual template. The virtual template can include pretty much everything you would use on a regular interface.

IPsec VTI Virtual Tunnel Interface - NetworkLessons.com

The ASA supports a logical interface called Virtual Tunnel Interface (VTI). As an alternative to policy based VPN, a VPN tunnel can be created between peers with Virtual Tunnel Interfaces configured. This supports route based VPN with IPsec profiles attached to the end of each tunnel. This allows dynamic or static routes to be used.

An IPsec profile contains the required security protocols and algorithms in the IPsec proposal or transform set that it references. This ensures a secure, logical communication path between two site-to-site VTI VPN peers. IPsec profile example configuration:

Configuring Cisco ASA for Route-Based VPN

Cisco @ IPsec VTIs are a new tool that customers can use to configure IPsec-based VPNs between site-to-site devices. IPsec VTI tunnels provide a designated pathway across a shared WAN and encapsulate traffic with new packet headers, which helps to ensure delivery to specific destinations.

IPsec Negotiation/IKE Protocols - Cisco

This document describes how to configure an Adaptive Security Appliance (ASA) IPsec Virtual Tunnel Interface (VTI) connection. In ASA 9.7.1, IPsec VTI has been introduced. It is limited to sVTI IPv4 over IPv4 using IKEv1 in this release. This is an example configuration for the ASA to connect to Amazon Web Services (AWS). Note: Currently VTI is only supported in single-context, routed mode. Configure AWS. Step 1. Log in to the AWS console and navigate to the VPC panel.

Configure ASA IPsec VTI Connection Amazon Web Services - Cisco

Dynamic Multipoint VPN (DMVPN) is a Cisco IOS Software solution for building scalable IPsec Virtual Private Networks (VPNs). It allows branch locations to communicate directly with each other over the public WAN or Internet, such as when using voice over IP (VOIP) between two branch offices, but doesn't require a permanent VPN connection between sites.

Currently, VTI [IPSEC mode] works only ipv4 over ipv4 / ipv6 over ipv6. Per RFC, in ikev2, we could have an overlay dual stack [since we can have 2 TSi -TSr] but it's not yet implemented. A dual stack approach would consume more resources than GRE [which is available today].

IPsec VTIs (Virtual Tunnel Interface) is a newer method to configure site-to-site IPsec VPNs. It's a simpler method to configure VPNs, it uses a tunnel interface, and you don't have to use any pesky access-lists and a crypto-map anymore to define what traffic to encrypt.
