E. Hardware Description

Figure shows a typical power harvesting system. It includes an external energy source (vibration of dance floor), a transducer (Piezo electric crystal) to convert energy from external energy to electric power, a harvesting circuit to optimize the harvesting efficiency and a storage battery or a load circuit.

The mechanical energy created by dancers causing slight vertical deflection of the floor is converted into usable electrical energy by means of electromagnetic induction. Once captured, the energy will be transported through a simple circuit and used to power lights that will help to enhance the experience of the consumer without requiring external power.

In the clubs, initial estimates suggest an individual clubgoer could generate roughly 5 to 10 watts, and on a night where the dance floor is packed with moving bodies, the energy from the floor could supply about 60 percent of the club's total energy needs [source: Daily Mail]. Enough to save us from the world's energy crisis?

The Dancer. The Dancer uses human movement as a source of energy. Each floor module can produce up to 35 Wp of sustained output. This kinetic energy is directly converted into electricity. Through this process the floor interacts with the public and involves them in a unique and interactive energy experience. We use the generated electricity on the spot to power the floor's infinity LED lights.

This book discusses in detail the CMOS implementation of energy harvesting. The authors describe an integrated, indoor light energy harvesting system, based on a controller circuit that dynamically and automatically adjusts its operation to meet the actual light circumstances of the environment where the system is placed. The system is intended to power a sensor node, enabling an autonomous wireless sensor network

(WSN). Although designed to cope with indoor light levels, the system is also able to work with higher levels, making it an all-round light energy harvesting system. The discussion includes experimental data obtained from an integrated manufactured prototype, which in conjunction with a photovoltaic (PV) cell, serves as a proof of concept of the desired energy harvesting system.

Developing energy harvesting power supplies. It explains the overall system design and gives quantitative assumptions on environmental energy. It explains different system blocks for an energy harvesting power supply and the trade-offs. The text covers in detail different energy transducer technologies such as piezoelectric, electrodynamic, and thermoelectric generators and solar cells from the material to the component level and explains the appropriate power management circuits required in these systems. Furthermore, it describes and compares
