The correlation between the physiological and ultrastructural characteristics of the functional syncytium was studied in the heart muscles of the bivalve (molluscs). 2. A comparison of the responses to stimulation by intracellular and extracellular electrodes revealed that these hearts had a general property of unitary muscle.

Sporangiospores of *Rhizopus stolonifer* were examined at various stages of germination by scanning electron and phase-contrast microscopy. These observations were correlated with changes in spore dry weight, spore volume, respiration, and syntheses of ribonucleic acid, deoxyribonucleic acid, and protein during germination.
