Ratios And Proportions Algebra 1

A ratio is a way to compare two quantities by using division as in miles per hour where we compare miles and hours. A ratio can be written in three different ways and all are read as "the ratio of x to y" $x\text{:}y$ $\frac{x}{y}$ $x:y$ A proportion on the other hand is an equation that says that two ratios are equivalent.

Ratios and Proportion. A ratio is a comparison of two quantities by division. A proportion is an equation stating that two ratios are equal. Two ratios are equal if and only if their cross products are equal. To solve a proportion, use the fact that the cross products are equal. Set the cross products equal to each other and solve for the unknown value.

The simplest way to work with a ratio is to turn it into a fraction. Be sure to keep the order the same: The first number goes on top of the fraction, and the second number goes on the bottom. In practice, a ratio is most useful when used to set up a proportion – that is, an equation involving two ratios. Typically, a proportion looks like a word equation, as follows:
