A right triangle has one right angle and two acute angles. The side opposite the right angle is the hypotenuse and is the longest side. The other sides are called legs. If one of the acute angles is chosen the leg forming one side of the angle is called the adjacent leg. The leg opposite from the chosen angle is called the opposite leg. Right triangle. A right triangle is a type of triangle that has one angle that measures 90 ° . Right triangles, and the relationships between their sides and angles, are the basis of trigonometry. In a right triangle, the side that is opposite of the 90 ° angle is the longest side of the triangle, and is called the hypotenuse.
