A simple measure of taste sensitivity can be obtained by counting the number of fungiform papillae on the tip of the tongue. The technique given here was developed by Linda Bartoshuk, Yale University. Subjects swab the tip of their tongue with a cotton swab (e.g., a Q-tip) dipped in a dilute solution of methylene blue (or blue food coloring).

that are cold, may produce temporary taste insensitivity. People generally seem to taste most acutely when the stimulus is at or slightly below body temperature. When the tongue and mouth are first adapted to the temperature of a taste solution, sugar sensitivity increases with temperature rise, salt and quinine sensitivity decrease, and acid sensitivity is relatively unchanged.

Beyond the delineation of PROP taste sensitivity, genetic association studies have linked PTC/PROP taster status to an enormous range of phenotypic traits (reviewed in Guo and Reed 2001). It should be acknowledged that many of these reported associations may be false positives due to population stratification or to chance (Guo and Reed 2001).
