Thick Shell Plate A simply supported plate of equal side length is subjected to a normal pressure on the top face.

Differences between thick shell formulations (elform 2, 3 and 5) can be studied. Example 2 from Introductory Manual for LS-DYNA Users by James M. Kennedy. <https://www.dynaexamples.com/introduction/Introduction/example-02>

Thick shell form 5 in LS-DYNA is a layered 8 node brick element, with 4 nodes defining the bottom surface and 4 defining the top. For computational efficiency, each layer has one in-plane integration point.

The thermally thin shell has a constant temperature field over its thickness and expands only in length. The thermally thick shell, on the other hand, can map a temperature gradient across thickness, with the metal strip curving as a result of the change in thermal expansion across thickness. <https://www.dynaexamples.com/thermal/thick-thin-shells> <https://www.dynaexamples.com/@site-logo/LS-DYNA-Examples-Logo480x80.png>

In LS-DYNA, the eight-node solid thick shell element is still based on the Hughes-Liu and Belytschko-Lin-Tsay shells (Hallquist, 1998). A new eight-node solid element based on Liu, 1985, 1994 and 1998 is incorporated into LS-DYNA, intended for thick shell simulation.

When meshing adequately captures

bending deformation, thick-shell elements are more flexible because of the additional shear deformation that is not captured through thin-shell formulation. Given pure-bending deformation, however, the thin-shell element is slightly more accurate, therefore the thick-shell element may be stiffer for coarser meshes.

The thick shell element type 3 A solution might be a thick shell, sometimes referred to “ solid shell ” :

- Eight nodes like brick element
- Translation degree of freedom only
- Element shape describes the thickness (no thickness input)
- In LS-DYNA, see *SECTION_TSHELL
- In LS-DYNA three thick shells are available.

Page 2: Normals (Shell, Segment, TShell Normals) Purpose: This interface is for reviewing and reversing shell, segment, and thick shell normals. Consistent normals in a part may be required to meet mesh quality standards, for contact definitions in LS-DYNA, and also for post-processing shell results at various integration points.

When the Mooney-Rivlin Rubber material model is used with SHELL163 elements, the LS-DYNA code will automatically use a total Lagrangian modification of the Belytschko-Tsay formulation instead of using the formulation you specify via KEYOPT(1). This program-chosen formulation is required to address the special needs of the hyperelastic material.
